General Description

The HT6P20X is a CMOS LSI encoder designed for remote control system applications. It encodes 24 bits of information and then serially transmits it via the DOUT pin upon receipt of transmission enable (DATA pins: D0~D3) signals. The combination of address and data bits of the HT6P20X is designed using one time pro-

grammable process. In addition, the chip offers various packaging for flexible combination of programmable address/data so as to meet various applications. Its programmable address/data is transmitted together with the anti-code bits via RF or infrared transmission medium upon receipt of a trigger signal.

Functional Description
Normal Operation

The HT6P20X encodes and transmits address/data to a decoder upon receipt of a trigger signal. The transmission function of the HT6P20B/D is enabled by the D0~D3 pins (active low). The following is the transmission timing of the HT6P20X:

Transmission Timing

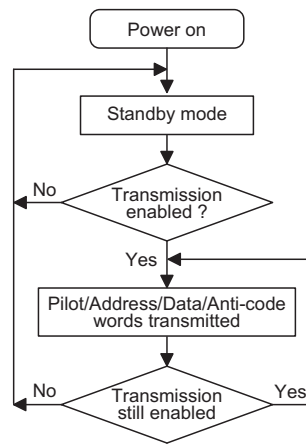

A complete code word of the HT6P20D consists of 3 periods as shown below.

A Complete Code Word for the HT6P20D

The HT6P20B/D detects the logic state of the internal programmed address and the external data pins, and then transmits the detected information during the code period. Each address/data bit can be set to one of the following two logic states:

Application Circuits

Note: In order to prevent the IC from getting damaged due to the latch up, the 100 Ω resistor or the LED which can also be a transmission indicator is indispensable.
